

Odds 365

Given odds against of an event say A is given to be 7 : 2, therefore probability of A is $P(A) = \frac{2}{7+2} = \frac{2}{9}$ and probability of B is $P(B) = \frac{7}{9}$. If it is 7 to 2 odds against A, then the probability of A is $\frac{2}{9}$ and the probability of B is $\frac{7}{9}$. In fact, the odds against A are 7 to 2, which means that for every 7 times A does not occur, it occurs 2 times. This is why the probability of A is $\frac{2}{9}$.
